Data Science Final Project – Questions

1. What is the main objective of your data science project?

2. How many rows and columns are present in the hospital dataset?

3. What data-cleaning steps did you perform, and did you find any missing or duplicate values?

4. Which Python libraries did you use for data analysis and visualization?

5. What are the different patient outcomes recorded in the dataset, and which outcome is most common?

6. How did you calculate the 30-day readmission rate, and what percentage of patients were readmitted?

7. Which hospital department has the highest average treatment cost?

8. What is Exploratory Data Analysis (EDA), and how did you use it in this project?

9. What does a correlation heatmap show, and how can it help interpret the numerical variables in your dataset?

10. What are the main conclusions and limitations of your analysis?
